Chapter 1. Writing with localization in mind

Translation-friendly text

Learn a few tips to make your text easier to translate and less likely to cause translation errors.

Clarity

A text that is easy to understand is usually also easier to translate. To make your writing clearer, use these tips:

- Avoid overly long sentences and paragraphs.
- Repeat important words to avoid misunderstanding.

~~If the shaft of your wand breaks, you can get a new **one** online.~~

If the shaft of your wand breaks, you can get a new **wand** online.

- Don't describe more than one action in a sentence unless writing about strictly related actions.
- Use words such as "and," "then," "but," "a," "the," "this," and "that" to make your message clear.

Grammar

You can make your text easier to understand by using certain grammatical forms. To make your writing clearer, follow these rules:

- Express actions with verbs, not nouns.

~~Applying excessive force can lead to **rupture** of your wand.~~

If you apply excessive force, your wand can **break**.

- Use active voice.

- Split clusters of nouns into smaller logical units.

~~magic wand cleaning center~~

center for cleaning magic wands

Formating

Search your text for unintended linebreaks and punctuation marks (such as periods in place of commas). [CAT](#) tools may misinterpret such characters and split sentences into separate units. This can lead to translation errors and inconsistencies.

Avoid using pagebreaks and empty lines to layout your document. The same content can have a different volume in different languages.

Important:

When localizing a DITA project, always send the translators your source files rather than the output (such as PDF or HTML files).

Non-translatable content

Learn about types of content that you may wish to leave untranslated.

Types of non-translatable content

While planning the localization of your project, it is important to identify fragments you don't want to translate. These can include the following:

- proper names, such as brand names
- contact details
- code blocks
- user interface (UI) text (if the UI is not localized)
- legal text (may need to be handled separately)

**Tip:**

You can use [glossaries \(on page 3\)](#) to let translators know which phrases they shouldn't translate.

UI text

If your project contains UI terms, it's important to know whether the UI has been translated to target languages. If the UI is not localized, you should let translators know how they should handle UI text. For example, you may want them to follow each UI term with a translation in brackets.

[Glossaries \(on page 3\)](#)

Glossaries

Learn the benefits of using glossaries in your localization process.

Consistency

Glossaries are the easiest way to improve the consistency of translated text. Different translators (or even the same translator at different times) can translate the same term in various ways. Giving them a glossary of approved translations will make their translations more consistent.

**Note:**

Most [CAT](#) tools enable automatic terminology checks to make sure that a translator has used terms from the glossary. Such checks, however, are less reliable in languages in which the same word can have various grammatical forms .

Non-translatable text

Glossaries can also specify text that should not be translated, such as brand names.

Forbidden terms

If you don't want a given term to be translated in a particular way, a glossary is also a good place to specify that.

For example, the word "pacemaker" can be translated into Polish as "rozrusznik", but you may want translators to use the less colloquial "stymulator" instead.

Context

Glossaries can also provide context for each term, such as its definition.

Format

Glossaries (called term bases) can be developed directly in a CAT tool. Most CAT tools have their own term base format, but you can use a universal format called TermBase eXchange (TBX) to exchange term bases between different tools.

You can also prepare a glossary as a [CSV](#) file in a spreadsheet editor and then import it into a CAT tool.

Figure 1. A simple bilingual glossary developed in a spreadsheet editor

	A	B
1	English	Polish
2	curse	klątwa
3	magic	magia
4	magic wand	magiczna różdżka
5	spell	czar
6	spell book	księga czarów
7	wand	różdżka
8	wizard	czarodziej

Related information

[Non-translatable content](#) (*on page 2*)

Localization-friendly images

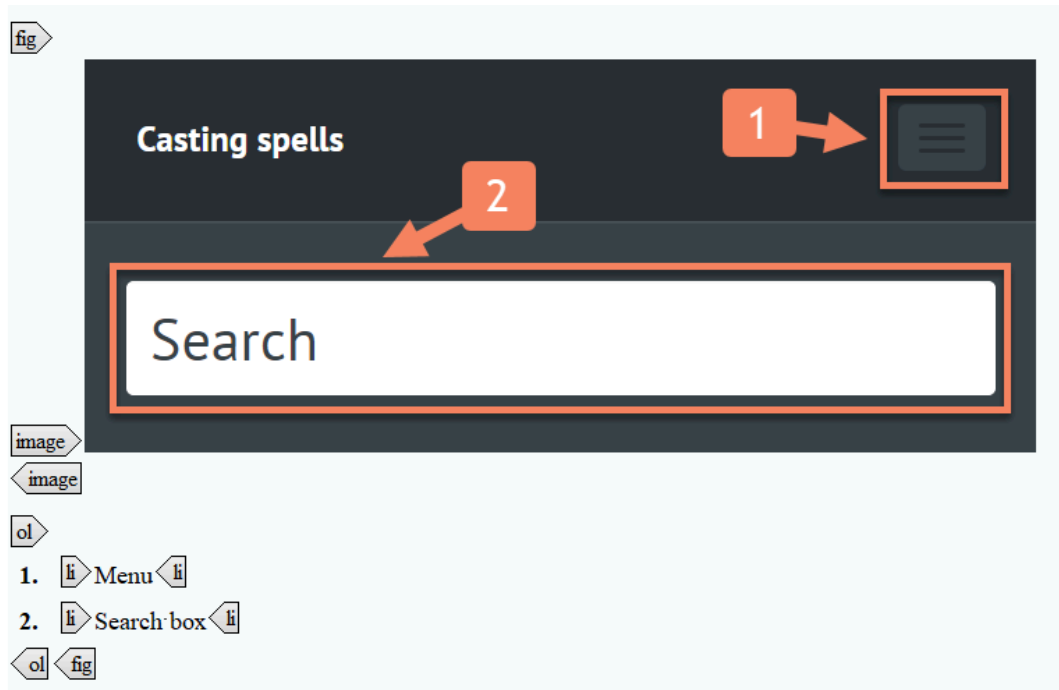

Learn a few tips to make your images easier to localize.

Image format

If your images contain text that you won't to translate, avoid using bitmaps, such as JPG or PNG files. Instead, use [SVG](#) files. Most [CAT](#) tools can translate text contained in SVG files.

Callouts

To simplify the localization process, avoid using descriptions within images. Instead, use numbered callouts and explain them under the image.

UI screens

If your documentation contains user interface (UI) screens, it is important to consider whether the UI is localized. You may need to plan additional steps to prepare UI screens in target languages.

[Non-translatable content \(on page 2\)](#)

Chapter 2. Preparing content in oXygen

Project structure

Learn how the structure your project can make localization easier.

Folder structure

A logical folder structure will make localization much easier. Do not keep all files in one folder. Instead, create separate folders for your topics, images, and other content.

Tip:

To avoid publishing problems, always store your DITA maps at the same level or above your topics and images.

Prefixes vs. folders

It is common practice to prefix topic names with "c_", "t_", "r_" and "_g" for concepts, tasks, references, and glossary entries, respectively. For example:

- **c_magic_wand.dita**
- **t_how_to_cast_a_spell.dita**
- **r_wand_specifications.dita**
- **g_wand_shaft.dita**

For larger projects, it may be useful to create separate folders for topics of each type. This will make managing the project easier.

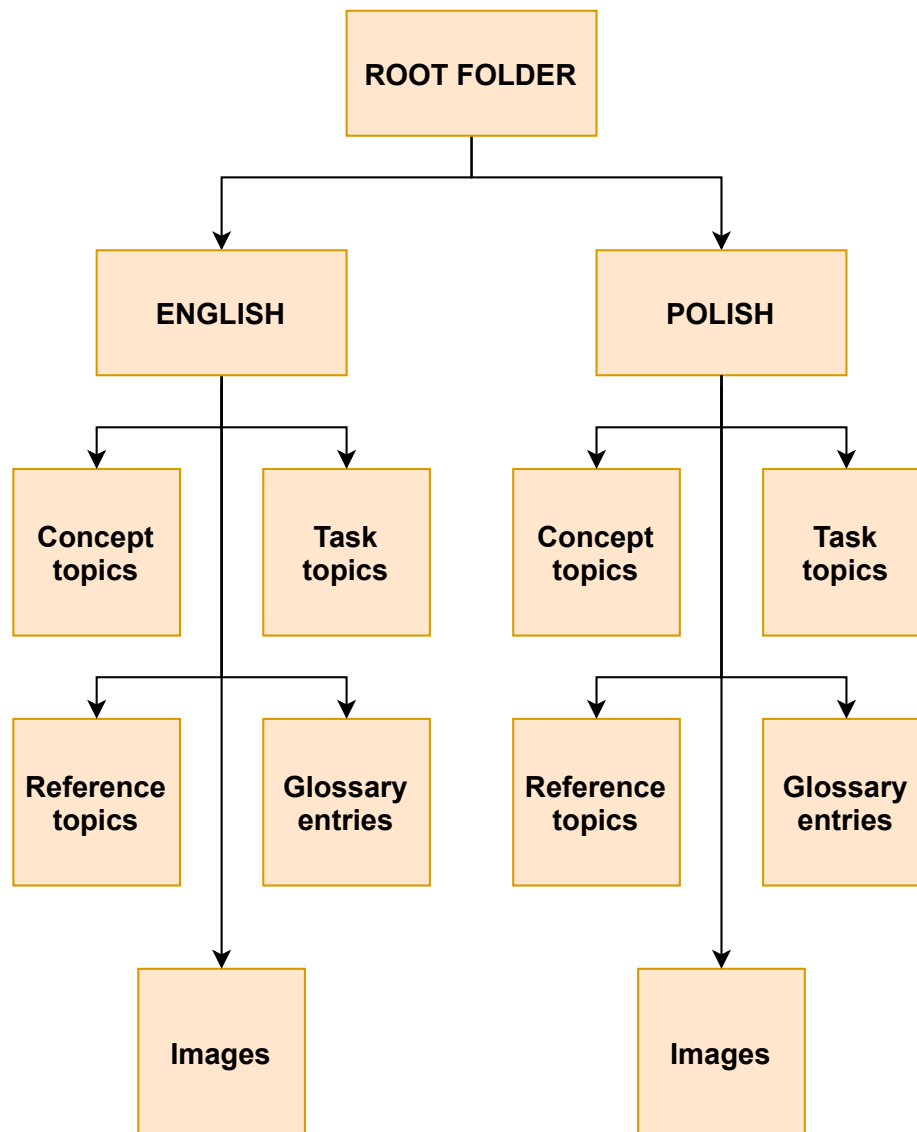

Figure 2. Example structure of a project with separate folders for different types of content

Language versions

To make the localization process easier, create a separate subfolder for each language version. Each subfolder should have the same structure.

Figure 3. Example structure of a multilingual project with separate folders for different language versions

Untranslated files

Some files, such as images and other content, will be shared among language versions. They don't need to be translated. It's a good idea to keep files you don't want to translate in a separate folder.

Figure 4. Example structure of a multilingual project with a separate folder for files you don't want to translate

[Importing a DITA project into memoQ \(on page 14\)](#)

Preparing DITA code for localization

Learn how to prepare your DITA code for localization using the `xml:lang` and `translate` attributes.

Setting the language of topics and maps

It's a best practice to specify the language of your DITA files, even if you're not planning localization. To specify the language and country of a topic or map, set the `xml:lang` attribute of its root element:

```
<concept id="c_magic" xml:lang="en-US">
```

**Tip:**

To set an attribute of an element in [oXygen XML Editor](#), select the element, press **Alt + Enter**, and type the name of the attribute you want to set.

Identifying content you don't want to translate

To identify a fragment you don't want to translate, set the `translate` attribute to "no":

```
<codeblock id="codeblock_spells" translate="no">
    let spellsLeft = 7;
</codeblock>
```

Related information

[Non-translatable content \(on page 2\)](#)

[Project structure \(on page 6\)](#)

[Text sorting and direction \(on page 9\)](#)

Text sorting and direction

Learn how to adjust text sorting and text direction in localized files.

Sorting text using the sort-as element

In languages like English you can easily sort lists by alphabetical order. But it's not always that simple in languages such as Japanese and Chinese. That's because the same character can have different pronunciations depending on the meaning.

To specify text you want to use for sorting, add a `sort-as` element inside a sorted element:

```
<glossentry id="gloss-harry-potter">
    <glossterm>&#x30CF;&#x30EA;&#x30FC;&#x30FB;&#x30DD;&#x30C3;&#x30BF;&#x30FC;</glossterm>
    <prolog>
        <sort-as>Harry Potter</sort-as>
    </prolog>
    <glossdef></glossdef>
</glossentry>
```

Sorting index terms using the index-sort-as element

Similarly, you can adjust the starting order of index terms by adding the `index-sort-as` element:

```
<indexterm>&#x30CF;&#x30EA;&#x30FC;&#x30FB;&#x30DD;&#x30C3;&#x30BF;&#x30FC;

  <index-sort-as>Harry Potter</index-sort-as>

</indexterm>
```

Changing text direction using the dir element

English and many other languages use left-to-right (LTR) script. But there are many languages like Hebrew or Arabic that use right-to-left (RTL) script. To optimize localization, it's a best practice to specify text direction using the `dir` attribute:

```
<map xml:lang="ar-IQ" dir="rtl">
```

Tip:

To set an attribute of an element in [oXygen XML Editor](#), select the element, press **Alt + Enter**, and type the name of the attribute you want to set.

Related information

[Preparing DITA code for localization \(on page 8\)](#)

Content reuse

Learn about best practices for reusing content that will help you avoid problems with localization.

Handling conrefs

You can easily reuse content in DITA with the `conref` attribute.

Figure 5. Example of content referencing in DITA

TOPIC 1:

```
... <note id="note_cts" type="danger">Casting too many
spells a day can lead to carpal tunnel syndrome.</note>
```

TOPIC 2:

```
... <note id="note_ap2_4h2_kpb"
conref="c_introduction.dita#c_introduction/note_cts"
... />
```

**Tip:**

To set an attribute of an element in [oXygen XML Editor](#), select the element, press **Alt + Enter**, and type the name of the attribute you want to set.

Improper use of content referencing can lead to translation errors (such as wrong grammatical forms or text not matching the context). To avoid such errors, follow these rules:

- Don't use conrefs for incomplete phrases. Instead, use them to reference whole sentences or larger fragments.
- Avoid excessive content reuse. This can make it harder for translators to know the context of translated text.

Handling keyrefs

You can reference keywords using the `keyref` attribute. Keyrefs can be used for standard text or expressions that can change, such as product names.

Figure 6. Example of keyword referencing in DITA

DITAMAP:

```

<keydef keys="product">
  <topicmeta>
    <keywords>
      <keyword>Enchanter</keyword>
    </keywords>
  </topicmeta>
</keydef>

```

TOPIC:

```

<title>Casting spells using your
<keyword keyref="product"/> wand</title>

```

When used improperly, keyrefs can lead to translation errors. You can avoid such errors by following these tips:

- Use keyrefs for terms that do not change their grammatical form, such as product names or UI terms.
- Avoid using keyrefs for common nouns.
- Treat keyrefs as proper nouns and don't precede them with articles.

**Tip:**

To avoid translation errors, it may be a good idea to [resolve all conrefs and keyrefs \(on page 12\)](#) before localizing your project.

Related information

[Project structure \(on page 6\)](#)

Resolving conrefs and keyrefs

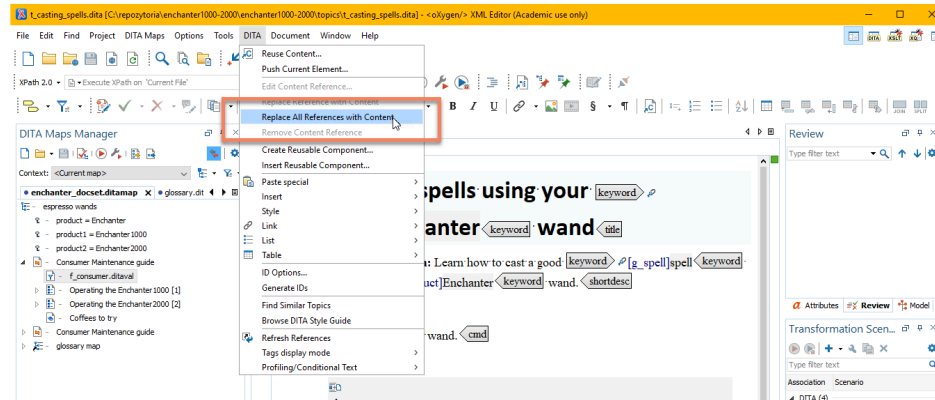

Learn how to quickly replace content references and keyword references with relevant content in oXygen XML Editor.

When preparing your project for localization, it may be useful to replace content references (conrefs) and keyword references (keyrefs) with appropriate content. To resolve all conrefs and keyrefs in a topic in [oXygen XML Editor](#), follow these steps:

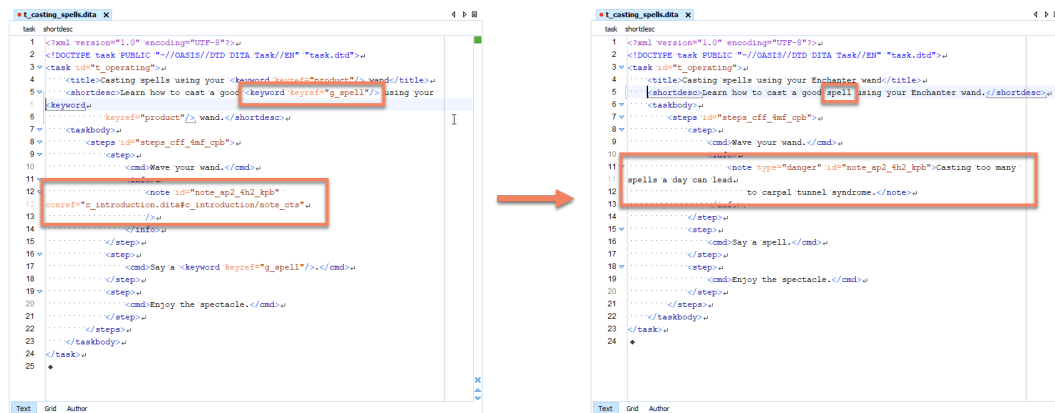

1. Open a topic containing references and switch to the **Author** mode.

2. Go to DITA > Replace All References with Content.

All references in the topic are replaced with relevant content.

Chapter 3. Translating content in memoQ

Importing a DITA project into memoQ

Learn how to import your DITA project into *memoQ* while preserving the project's folder structure.

When translating a DITA project, it is important to preserve the relationships between files. To import your project into memoQ without losing the project's folder structure, follow these steps:

1. Go to **Project > New Project > New Project**.

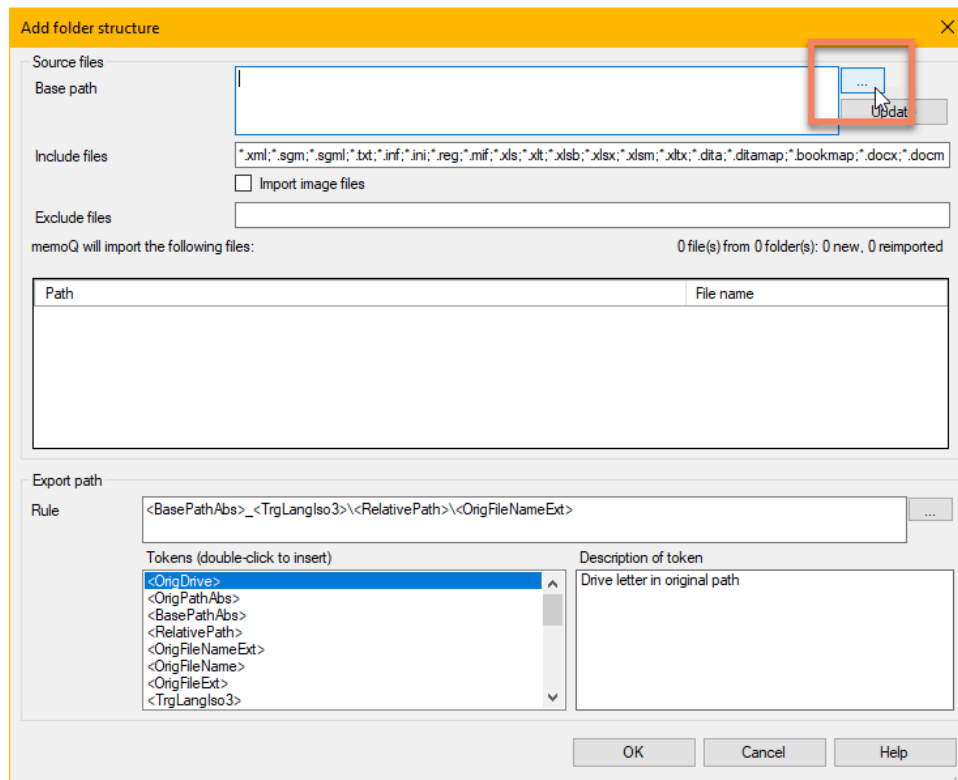

2. In the **New memoQ project** dialog, enter the **Name** of the project.
3. Choose a **Language pair**.

A screenshot of the 'New memoQ project' dialog box. The 'Project information' section is active, showing fields for Name, Language pair, Project, Domain, Description, Project directory, Created by, Created at, Deadline, and checkboxes for 'Record version history for translation documents' and 'Connect to a content source'. The 'Name' field contains 'Enchanter 1000_2000'. The 'Language pair' dropdown is open, showing 'English-Polish' as the selected option. The 'Project directory' field shows a path: 'C:\Users\lukas\OneDrive\Dokumenty\My memoQ projects\Enchanter 1000_2000'. The 'Created by' field contains 'John Doe' and the 'Created at' field shows '23 kwietnia 2021'. The 'Deadline' field shows '2021-04-23 17:25'. The 'Next >' button is highlighted.

4. Enter the **Client** and any optional details, then click **Next**.
5. Skip the **Translation documents** step.
6. In the **Translation memories** step, choose or create a translation memory.
7. In the **Term bases** step, choose or create a term base.
8. Click **Finish**.
9. Go to **Documents > Import > Import Folder Structure**.

10. Click ... next to the **Base path** field, choose the folder where your project is located, and click **OK**.

11. In the **Document import options** dialog, remove any files you don't want to translate.

Project files are ready for translation.

**Tip:**

To export a translated project, right-click on the root folder and choose **Export > Export (Stored Path)**.

Related information

[Project structure \(on page 6\)](#)

[Translating repetitions \(on page 17\)](#)

Translating repetitions

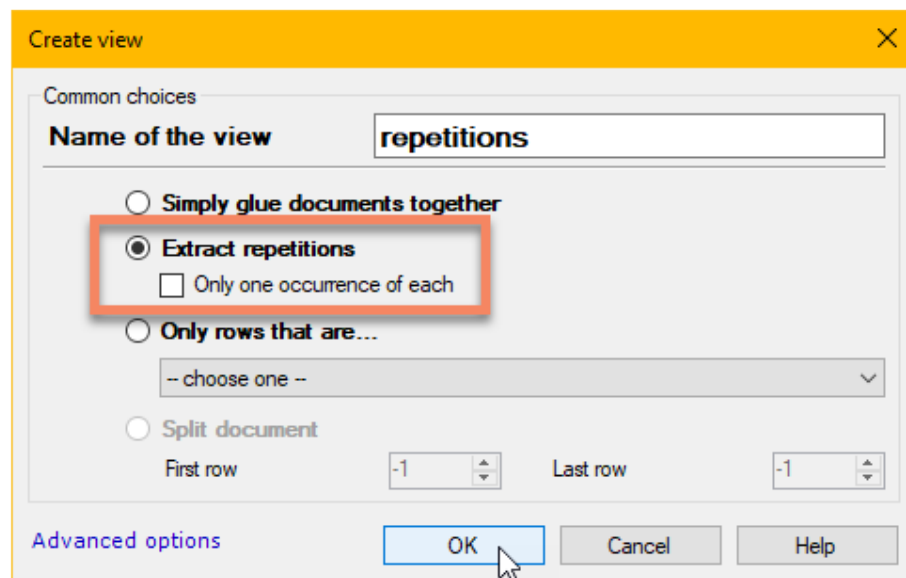

Learn how to simplify your translation process in memoQ by creating a view containing only repetitions.

If your DITA project contains a lot of repetitive content, it may be useful to include all repetitions in one view. In order to create a view containing all repetitions in [memoQ](#), follow these steps:

1. Go to **Project home > Translations** and select all files.
2. Right-click the files and choose **Create View**.

3. In the **Create view** dialog, enter the **Name of the view**, select **Extract repetitions**, and click **OK**.

You can work on a view containing all repeating segments in your project.

Chapter 4. Glossary

Learn basic terms associated with the localization of DITA projects.

CAT

Computer-Assisted Translation; the use of software tools (such as translation memory tools and terminology managers) to assist a human translator in the translation process.

CSV

Comma-Separated Values; a text file format that uses commas to separate values.

DITA

Darwin Information Typing Architecture; a standard XML-based architecture for creating topic-based documentation.

memoQ

A popular computer-assisted translation (CAT) software suite that runs on Microsoft Windows operating systems.

oXygen XML Editor

A popular XML editor offering advanced features for working with DITA projects.

SVG

Scalable Vector Graphics; an XML-based vector graphics format.

XML

eXtensible Markup Language; a markup language designed to store and transport data in a format that is both human-readable and machine-readable.
